Cau Giay, HN | (+84) 916627917 | maynguyen24.work@gmail.com | [Linkedin](#)

SUMMARY

Fullstack Engineer with 3+ years in fintech, building e-wallet and digital banking systems with Node.js, Golang, and microservices, including core banking integrations (T24 Temenos, NAPAS) for clients across Vietnam, Thailand, and Australia.

WORK EXPERIENCE

JITS INNOVATION LABS - Mid-level Full-stack Developer

Jan 2025 - Present

Project: Digital Wallet Core

Tech: Sails.js, MongoDB, Next.js, Golang, NestJS

- Built and maintained scalable backend and frontend services serving 50,000+ monthly users, delivering features 15% ahead of schedule.
- Led zero-downtime migration from MongoDB 6 to 8 for a production financial system.
- Migrated core transaction logic to Golang, achieving a 45% increase in concurrent transaction performance.
- Developed core banking features: interbank transfers, regulatory reports, reconciliation, and bill payments.
- Designed and optimized secure, high-availability backend services for financial transactions.
- Participated in frontend migration from AngularJS to Next.js, utilizing AI-assisted tools to improve development efficiency and application performance.
- Implemented unit testing with Mocha & Chai, achieving 80%+ code coverage to ensure system reliability and maintainability

Project: BNF Digital Banking (Digital Banking)

Tech: Sails.js, MongoDB, Microservices, Kafka, Next.js

- Led a small team of developers (5 members), mentoring junior/fresher engineers to improve code quality, problem-solving skills, and development best practices.
- Integrated interbank transfer flows via NAPAS, handling transaction routing, status tracking, and reconciliation with T24 Core Banking System.
- Developed and integrated real-time transaction processing with T24 Temenos Core Banking System.
- Built event-driven transaction pipelines using Kafka to handle asynchronous processing of banking events (transfers, notifications, reconciliation) with guaranteed delivery and idempotency.

Project: VSF VPAY E-wallet (Vingroup)

Tech: Sails.js, MongoDB, Microservices

- Integrated cash-in/cash-out flows with Techcombank and NAPAS, handling bank transfer reconciliation and real-time balance synchronization.
- Developed bill payment features and integrated multiple third-party service providers (electricity, water, telecom) with idempotent transaction handling and failure recovery.
- Developed transaction history and statement features with advanced filtering, pagination, and date-range queries for high-volume e-wallet data.
- Optimized State Bank regulatory reporting and reconciliation systems using MongoDB Aggregation Pipeline, reducing report generation time for large-scale transaction datasets.
- Extended core e-wallet platform with Vietnam-specific features including local payment methods and compliance with State Bank of Vietnam regulations.

Project: Fintech AI Context Engine

Tech: NestJS, Kafka, Microservice, PostgreSQL, Temporal, Grafana

- Built an AI context engine for an electronic transaction platform to provide contextual data processing and orchestration for AI services.
- Implemented Kafka-based CDC streaming between core banking systems and the AI contextual engine, while integrating with the e-wallet core platform.Grafana
- Managed workflow orchestration and distributed state handling using Temporal, and integrated AI caller SDKs for service communication.
- Monitored system metrics, observability, and performance dashboards using Grafana and Prometheus.

NCC ASIA - Backend Developer

Nov 2023 - Dec 2024

Project: TRUDI (Australia)

Tech: ASP.NET 8, PostgreSQL, Kafka, Redis, Angular, Express.js

- Architected CRM reporting service with Redis caching, reducing database load by 30%.
- Led migration from AWS S3 to Minio, cutting storage costs by 20%.
- Optimized PostgreSQL performance through query tuning, indexing strategies, and table partitioning, improving reporting query speed for large datasets.
- Designed Kafka-based data pipeline to synchronize and process system data across services, reducing data processing latency.
- Integrated third-party VoIP service into a Node.js backend to manage and track inbound/outbound calls between sales agents and customers within the CRM workflow.

EDUCATION**HANOI UNIVERSITY OF MINING AND GEOLOGY**

Software Engineering

Sep 2021 - July 2025

GPA: 3.2/4

SKILLS

Programming Languages: JavaScript/TypeScript, Golang

Frameworks & Libraries: Node.js, NestJS, Next.js, Sails.js, ASP.NET

Databases: PostgreSQL, MongoDB

Tools & Technologies: Docker, Kafka, Redis, GitLab, AI-assisted development tools (Claude, Gemini)

Languages: English (Intermediate , targeting 700+), Japanese (JLPT N4, targeting N3)
